Pairwise comparison report

Abstract

This report gives a comparison between GE and MSFT.

1 Share components

This section contains components which are shared between GE and MSFT. There are 4 common components in total. They are will be fully described in Table 1.

Table 1: Share components

Description	GE	MSFT
Plot of posterior mean and variance		•This component is a smooth function with a typical lengthscale of 2.4 days.The marginal standard deviation of the function increases linearly		•This component is periodic with a period of 0.8 years but with varying amplitude.The amplitude of the function increases linearly.The shape of this function within each period has a typical lengthscale of 4.4 months		•This component models uncorrelated noise.The standard deviation of the noise increases linearly		
Continued on next page

Table 1 – *Continued from previous page*

Description	GE	MSFT
•This component is periodic with a period of 7.6 months.The shape of this function within each period has a typical lengthscale of 7.4 days		
2 Individual components

This section contains components which are differed between GE and MSFT. There are 2 components in total. They are will be fully described in Table 2.

Table 2: Individual components

Description	GE	MSFT
Plot of posterior mean and variance		•This component is periodic with a period of 0.8 years but with varying amplitude.The amplitude of the function increases linearly.The shape of this function within each period has a typical lengthscale of 3.2 months		
•This component is periodic with a period of 1.0 years.The shape of this function within each period has a typical lengthscale of 2.2 weeks
